## Structure:

### Storyboards

Each web page is structured similarly with a banner at the top of the page, a footer at the bottom, and the main content of the page taking up the rest of the page. I achieved this structure with the CSS flexbox display.

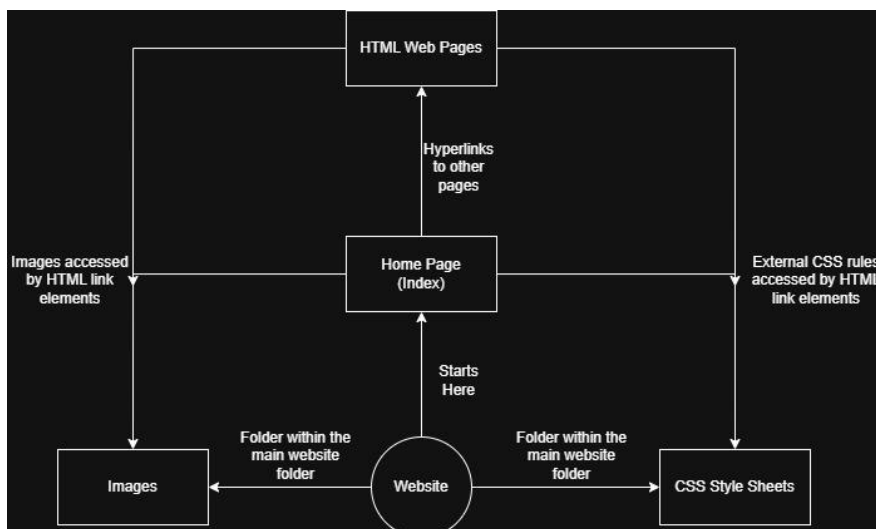

All storyboards are included in the documents folder in the website directory.

The whole body of each page is a flexbox with the column flex direction, and each section (banner, main content, footer) are items of the body flexbox. Additionally, the banner and main content items were also made as flexboxes to make it easier to structure each group properly. The banner flexbox contains the logo and another “banner-right” (class name) column flexbox each containing a header for the page title and a paragraph for a description of the page. The main content flexboxes are all structured differently across each web page to fit each page's specific needs.

## Concept Map

This concept map shows the basic logic of the website, all the components are within the main website directory, and the first viewed page will be the index page. From this home page, the website navigates to all other pages. It also shows how each page accesses images and external CSS through HTML link elements.

## CSS

### Flexbox

Using the flexbox display made designing the website easier. It allowed me to easily separate each section of the page by making each section flex items as well as the banner and main content sections separate flexboxes.

The flexbox display also made it easier to align the footer to the bottom of the page by justifying footers to the flex end and changing the flex properties of the main content div.

The similar flexbox structure shared between each web page means I was able to repeat less code by putting the rules for how the elements of my website are structured in a singular external CSS sheet, although the main content sections all needed different structures, so I had to include the rules for those in separate internal CSS elements. This made the website easier to program while achieving the same intended result.

### Design Choices

The background colour for most of the website was changed to light gray instead of the default white for easier reading, the background colour for the banners and footers were changed to a darker gray to make it easier to distinguish between them and the main content.

Most of the text on the website is kept in the default black colour to keep it easier to read. The hyperlink text is kept more colourful to distinguish between them and regular text.

Header elements have a strong weight to show that they are titles rather than regular paragraph text. I set the banner paragraphs to italics to differentiate them from the regular text in the main content sections.

When deciding when to use external, internal, or inline CSS, I generally tried to use external for rules that apply to all pages, internal for rules that only apply to specific pages, and inline for rules that only apply to one element.

## HTML

The HTML used for the website is very simple; most paragraphs are made with the p element, page headings made with h elements, div elements to group sections of the

pages, figure elements to group images and captions, and nav elements to create horizontal lists of links to switch to other pages or to other points in a page.

In the head container element, meta elements are used to set the character set and the properties for the viewport (the displayed screen of the website) to make the width of the display match the width of the device and set the initial zoom scale of the website to 1. Link elements are used to connect the HTML file to the external CSS file, while style elements are used to set the CSS rules specific to each page.

Class attributes are used in the elements frequently to define CSS rules for similar elements across the whole website. Id attributes are used in the resume page to navigate to different sections of the page, although the page is small now it will be useful as I begin to add experiences, qualifications, and skills to my resume.

## Validations

HTML validated at: <https://validator.w3.org/>

CSS validated at: <https://jigsaw.w3.org/css-validator/validator.html.en>

All validations are included in the documents folder in the website directory.

## Index.html

Document checking completed. No errors or warnings to show.
